

## Clean Water for Our Customers

This brochure provides a snapshot of last year's water quality data for San Jose Water (SJW). Included are details about where your water comes from and how your water quality compares to State standards. SJW is pleased to report that your tap water met all USEPA and State primary drinking water health standards in 2021. As a member of the Partnership for Safe Water, SJW remains focused on water quality and environmental stewardship to ensure continued delivery of safe and high quality water to our customers. Since joining the Partnership for Safe Water, SJW has increased distribution system residual disinfectant levels and outperformed industry benchmarks in reducing main breaks. These Partnership-related improvements have contributed to increased water service reliability and enhanced public health protection.

Lake Williams in the Los Gatos Watershed.

Ultrafiltration modules, like the one shown above, remove parasites, bacteria, and viruses from the water.

## San Jose Water's Montevina Filter Plant Receives Directors Award from the Partnership for Safe Water

The Montevina Filter Plant received the 2022 Treatment Program Directors Award from the Partnership for Safe

Water. This is in addition to having first received in 2013 a Distribution System Optimization Program Directors Award. The Partnership for Safe Water is a program developed by EPA, AWWA, and associated Partner organizations to guide water utilities towards improving water quality by optimizing system operations. The Directors Award is awarded only after completing a Self-Assessment followed by a rigorous Peer Review. This includes a comprehensive evaluation of treatment plant operations and performance, identification of performance limiting factors, and the development of action plans to achieve optimization.

The Partnership is a voluntary effort between six drinking water organizations, more than 250 water treatment utilities, and 150 distribution systems. The goal of the Partnership is to provide a new measure of public health protection to millions by implementing prevention programs where legislation or regulation does not exist. The preventative measures are based around optimizing plant performance and distribution system operation. The result is the production and delivery of superior quality water to all users.

Completed in 2018, the award-winning Montevina Filter Plant can produce 30 million gallons of clean, safe drinking water a day, and deliver up to 5 billion gallons of water each year using state-of-the-art ultrafiltration. The process clarifies and decontaminates the water (removing bacteria, viruses, algae, pollen, etc.) by passing it through porous and hollow fiber membranes that block all unwanted particles.

Most recently at the Montevina Filter Plant, SJW built a state-of-the-art microbiology laboratory. This laboratory allows SJW staff to rapidly evaluate the safety of the drinking water by testing for coliform bacteria and other microbes in samples collected throughout the distribution system.

### 1. Source water

Water is collected in the Los Gatos Watershed by intakes that carry water to the Montevina Filter Plant. SJWC leaves sufficient water, as permitted by the California Department of Fish and Wildlife, to support the native species that need water to thrive.

### 2. Pre-treatment

**Coagulation:** To remove impurities coagulants are added to form larger particles.

**Sedimentation:** The large, heavy particles then settle out at the bottom of the basin.

### 3. Treatment

After pre-treatment, water is pushed through ultrafiltration membranes. These membranes remove parasites, bacteria and viruses.

### 4. Storage

The finished water is stored in large tanks called Clear Wells for distribution.

### 5. Disinfection

The finished water is disinfected with chloramines, resulting in clean, fresh-tasting water that meets or exceeds all State and Federal regulatory standards.

### 6. Delivery

Clean, fresh, high-quality drinking water is delivered to our customers' taps.

# IMPORTANT DEFINITIONS

## Detection Limit for Purposes of Reporting (DLR):

The lowest level of a constituent that the Department of Public Health requires to be reported.

**Maximum Contaminant Level Goal (MCLG):** The level of a contaminant in drinking water, below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.

**Maximum Contaminant Level (MCL):** The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

**Maximum Residual Disinfectant Level (MRDL):** The level of a disinfectant added for water treatment that may not be exceeded at consumer's tap.

**Maximum Residual Disinfectant Level Goal (MRDLG):** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**Not Applicable (N/A):** Not applicable.

**Not Detected (ND):** If a constituent is not measured at or above a DLR, it is reported as ND.

**Not Sampled (NS):** Source designated non-vulnerable or testing not required.

**Notification Level (NL):** A non-regulatory, health-based advisory level for contaminants in drinking water that do not have established Maximum Contaminant Levels. Systems are required to report exceedances to their governing boards and Public Authorities.

**Primary Drinking Water Standard (PDWS):** MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

**Public Health Goal (PHG):** The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

**Regulatory Action Level (AL):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

**Response Level (RL):** A non-regulatory, precautionary health-based level. Water systems are required to remove from service, provide treatment, or notify all impacted customers directly for any water source exceeding this level.

**Treatment Technique (TT):** A required process intended to reduce the level of a contaminant in drinking water.

## UNITS

**Nephelometric Turbidity Units (NTU):** A measure of the cloudiness of the water.

**One part per million (ppm):** One milligram per liter (mg/L). One ppm corresponds to a single penny in \$10,000 or one minute in two years.

**One part per billion (ppb):** One microgram per liter (µg/L). One ppb corresponds to a single penny in \$10,000,000 or one minute in 1,900 years.

**One part per trillion (ppt):** One nanogram per liter (ng/L). One ppt corresponds to a single penny in \$10,000,000,000 or one minute in 1.9 million years.

**pCi/L:** Picocuries per liter, a measure of radioactivity.

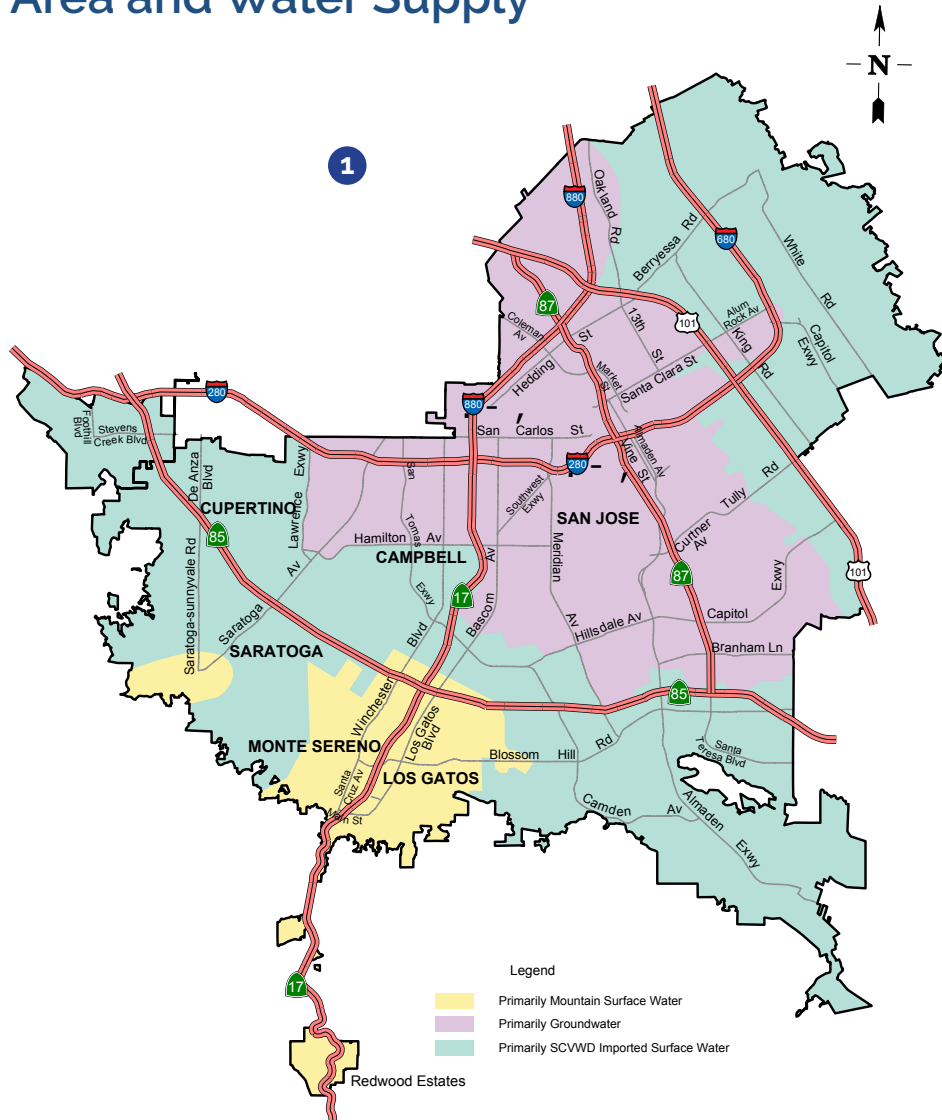

**TON:** Threshold Odor Number, a measure of odor.

**umho/cm:** Micromho per centimeter, a measure of electrical conductivity.

## San Jose Water Service Area and Water Supply

### How to Read the Water Quality Table

- Find your location on the map on this page. Note which is your source water area.
- Go to this column in the tables on the following pages to find the parameter you are interested in. Remember – no news is good news!
- This column notes the unit of measurement for the contaminant. For more information about these units see the Definitions section above.
- This column lists the maximum contaminant level (MCL). The MCL is the highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.
- This column lists the public health goal (PHG). At that amount or lower, there is no known or expected risk to health from the parameters' presence in drinking water. Not all listed parameters have state or federal goals.
- Find the column that corresponds to the source water that primarily serves you. This is the amount of the parameter detected in your area's water.
- The last column lists how the parameter typically gets into your drinking water.

# 2021 SJW Annual Water Quality Report

The State Division of Drinking Water specifies monitoring frequencies for some parameters less often than annually because the concentrations do not change frequently. Some of our data, though representative, are more than a year old.

**PRIMARY**

Primary standards relate to public health.

Copper	ppm	1.3	0.3				0.25	0		1, 10

<sup>\*</sup> This Consumer Confidence Report (CCR) reflects changes in drinking water regulatory requirements during 2021. These revisions add the requirements of the federal Revised Total Coliform Rule, effective since April 1, 2016, to the existing state Total Coliform Rule. The revised rule maintains the purpose to protect public health by ensuring the integrity of the drinking water distribution system and monitoring for the presence of microbials (i.e., total coliform and E. coli bacteria). The U.S. EPA anticipates greater public health protection as the rule requires water systems that are vulnerable to microbial contamination to identify and fix problems. Water systems that exceed a specified frequency of total coliform occurrences are required to conduct an assessment to determine if any sanitary defects exist. If found, these must be corrected by the water system. The state Revised Total Coliform Rule became effective July 1, 2021.

# SECONDARY

Secondary standards relate to aesthetic qualities such as taste, odor, and color but do not pose any health risk.

13 PRESENT

5 TESTED BUT NOT PRESENT

Perfluorohexanesulfonic acid (PFHxS)	ppt	N/A	N/A	NS	NS	2.9	ND - 5.2 <sup>*</sup>	ND	ND
Perfluorooctanoic Acid (PFOA)	ppt	5.1	10	NS	NS	ND	ND - 2.1	ND	ND
Perfluorooctyl Sulfonate (PFOS)	ppt	6.5	40	NS	NS	1.67	ND - 8.7 <sup>7</sup>	ND	ND
Vanadium	ppb	50	N/A	NS	NS	NS	NS	ND	ND - 5

## 7 Typical Sources of Chemical Constituents

1. Erosion or leaching of natural deposits
2. Runoff and leaching from agriculture
3. Residue from some surface water treatment processes
4. Industrial waste
5. Seawater influence
6. Discharge from factories and metal degreasing sites
7. By-product of drinking water disinfection
8. Naturally present in the environment
9. Soil erosion and stream sediments
10. Internal corrosion of plumbing systems
11. Water additive for promotion of public health
12. Disinfectant for water treatment

## Footnotes

- <sup>1</sup> This parameter is only applicable to surface water treatment techniques.
  - <sup>2</sup> There is currently no MCL for chromium-6. The previous MCL of 10 ppb was withdrawn on September 11, 2017. There is also currently no detection limit for reporting. All results less than 1 ppb are considered ND. SJW is continuing to report the sample results for informational purposes.
  - <sup>3</sup> Fluoride was not added to these sources.
  - <sup>4</sup> State regulations recommend an optimal fluoride level of 0.7 ppm be maintained in fluoridated treated water. Concentrations listed here are provided by San Jose Water's wholesalers.
  - <sup>5</sup> Compliance is determined by running average which remained below the SMCL level.
  - <sup>6</sup> The high end of the range is comprised of a single sample. SJW was unable to do a followup sample because the plant went offline shortly after it was taken. There were no complaints for taste and odor for customers served by that source.
  - <sup>7</sup> Wells above the notification limit went into standby and stopped serving water after those results were received. All customers who may have received water from these wells were notified directly by mail.
- <sup>^</sup> Last sampled in 2019.
- <sup>\*</sup> Due a conversion error the original CCR published erroneously listed this value as 8.3 ppt. A thorough data review revealed this error, and the highest range was corrected to the true value of 5.2 ppt.

SJW Distribution System Workers repairing hydrants.

SJW Water Quality staff collecting samples in the distribution system.

## Water Quality Guidance

### Source Water Assessment

An original assessment of the drinking water sources for SJW's water system was completed in December 2002 and is updated as new wells are brought online. SJW's wells are considered most vulnerable to one or more of the following activities, which have not been associated with any contaminants detected in the water supply: dry cleaners, automobile gas stations and repair shops, and underground storage tanks. Some of SJW's wells are also considered vulnerable to metal plating and finishing, photo processing/printing, electrical/electronics manufacturing, chemical/petroleum processing/storage, known contaminant plumes, and plastics/synthetics producers. SJW's surface supplies are considered most vulnerable to low density septic systems. Imported surface water purchased from Valley Water is considered most vulnerable to a variety of land use practices, such as agricultural and urban runoff, recreational activities, livestock grazing, as well as residential and industrial development. In addition, local sources are vulnerable to potential contamination from commercial stables and historic mining practices. Although these activities exist in areas near one or more of SJW's or Valley Water sources, physical barriers, treatment systems, and monitoring programs are in place to ensure that water supplied to our customers is not adversely affected. Customers seeking additional information are encouraged to contact SJW Customer Service at 408.279.7900.

### Special Populations

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate

means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

### Drinking Water Regulation

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791). The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

## Lead

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. San Jose Water is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/lead>.

### Lead sampling in the system

Data from the 2019 round of Lead and Copper Rule (LCR) sampling can be found in the Primary Standards table under Lead and Copper. To make LCR sampling as meaningful as possible, SJW worked with the state Division of Drinking Water and an outside consultant to identify the areas of highest risk for lead exposure from drinking water in our system. Compliance is determined by the 90<sup>th</sup> percentile of sample results. The 90<sup>th</sup> percentile for SJW's 2019 lead results was below the lead detection limit, and both lead and copper results met regulatory standards. SJW's next round of LCR sampling will occur in 2022. If you have reason for concern about lead containing fixtures in your home, please feel free to contact us at (408) 279-7900 to request sampling.

### Lead Sampling in Schools

In January 2018, Assembly Bill 746 went into effect requiring water utilities to collect lead samples in all daycare, preschool and kindergarten through 12<sup>th</sup> grade schools on public property to ensure students have access to safe drinking water. If a private school wished to have their water sampled, the head of the school could request lead testing from their water provider. The timeframe for sample collection ended in July of 2019. Over the span of the program, San Jose Water sampled 330 schools in our area, including all schools that requested sampling. Of the schools assessed, four initially had a result above the action level, but each was promptly resolved through corrective actions. For more information about sampling in your child's school, contact your school officials or check out the website at: [https://www.waterboards.ca.gov/drinking\\_water/certlic/drinkingwater/leadsamplinginschools.html](https://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/leadsamplinginschools.html).

## Fluoride

For information on fluoride in your water, please refer to our website at <https://www.sjwater.com/customer-care/help-information/fluoride>, or to see up-to-date concentrations local to your neighborhood.

## Nitrate

Nitrate as Nitrogen (Nitrate-N) in drinking water at levels above 10 mg/L is a health risk for infants of less than six months of age. Such Nitrate-N levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate-N levels above 10 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider.

## Turbidity

Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration systems.

## Reminder for Dialysis Patients and Aquarium Owners

Chloramine and chlorine may be present in the water provided by SJW. These chemicals are used to protect public health by destroying disease-causing organisms. Except for a slight chlorinous taste or odor, these disinfectants will not cause any problems for the general public. However, home dialysis patients and aquarium owners must take special precautions before the water can be used in kidney dialysis machines or aquariums. Please consult your doctor or dialysis technician to be sure your home equipment is adequate and proper tests are being performed every time it is used. Before filling an aquarium or fish pond, the disinfectant must be removed. Your local tropical fish store can help determine the best water treatment for your fish.

## To Learn More about the Quality of Your Water

Your drinking water is continually tested to ensure compliance with state and federal standards for quality and safety. This annual report summarizes the results of more than 18,000 water quality tests conducted throughout the year. If you have any questions about your water quality, service, or the information contained in this report, please call us at 408.279.7900, Monday to Friday between 8:30AM and 5:30PM. You may also contact the US EPA Safe Drinking Water Hotline at 800.426.4791 for additional public information about the Safe Drinking Water Act or US EPA's drinking water regulatory programs.
